DATA CONVERSION

■ OUTPUT RANGE AND DATA CONVERSION (FACTORY DEFAULT SETTING)

Discrete output data is converted into analog representations of 0 – 100% proportional to each scaled range.

Overrange output is possible from -15 to +115% of the nominal range.

When the signal exceeds the limit, the data is fixed at -15% or +115%.

(approx. -11.5 V or 11.5 V when the output range is -10 - +10 V)

- Output Range 0 – 5V DC

Digital Value, Decimal	Digital Value, HEX	Output Value, Engineering Unit	Output value, %
-1500	FA24	≤ -0.75V	-15%
0	0	0V	0%
10000	2710	5V	100%
11500	2CEC	≥ 5.75V	115%

RESPONSE TIME

Response time of analog output module is time form when 0 to 100% stepwise signal change is received by the communication ASIC of the module (slave) till when the analog output signal reaches 90%.

T_{COM} : MECHATROLINK-III transmission cycle set at master
(depends on system and configuration)

T_{OUT} : Output module response time \leq Output internal processing delay time (T_d) (one minimum transmission cycle the unit can handle) + Conversion rate (T_e) + Output Delay time (T_f)

E.g.: MECHATROLINK-III transmission cycle of 1 msec.

Output module response time (T_{OUT}): Output internal processing delay time (0.125 msec.) Conversion rate (0.2 msec.) + Output Delay time (0.25 msec.) = 0.575 [msec.]

I/O DATA DESCRIPTIONS

Scaling of analog output module is configurable with the configurator software (model: R7CFG). Refer to the software manual for details.

ANALOG OUTPUT

Data is represented in 16-bit binary. Negative value is represented in 2's complements.
